Neoplastic cells evolve within the context of their microenvironment. The microenvironment determines the selective pressures on those cells. That includes the other neoplastic cells, the stromal cells, extracellular matrix, nutrients, signaling molecules, and therapies. Both cancer prevention and therapy alter the microenvironment and thereby the evolution of the neoplastic cells. Whether we understand it or not, we are changing the ecology and evolution of neoplasms. Success in preventing and managing cancer will likely depend on a better understanding of the ecology and evolution of neoplastic cells, along with more strategic approaches to manipulating them. This session will focus on the evolution and ecology of both neoplastic progression and response to therapy.

Immune checkpoint inhibitors (ICI) revolutionized cancer therapy. However, the response rate is insufficient and more than half patients are still unresponsive. We need to further understand unresponsive mechanism(s) and improve therapeutic strategies. The remaining issues to be solved in ICI cancer immunotherapy are 1) to reveal resistant molecular mechanism(s) to ICI therapy, 2) to define precise biomarkers, and 3) to develop combination and/or personalized therapies with ICI. Since anti-tumor immune reaction is affected by both properties of tumor and the immune system, the therapeutic efficacy is dependent on many factors and interactions including unknown immune-escape mechanisms of cancer. Therefore, interdisciplinary insights through basic and reverse-translational researches should be integrated. Here we introduce different approaches regarding ICI therapies and discuss the current issues and future perspectives to catch the landscape of "tumor immunology".

本年6月、遺伝子パネル検査が我が国において保険償還され、癌ゲノム医療への期待は、診断、創薬、予防などへの展開に期待と注目がなされている。先行するNGS検査での臨床研究は、治験へのプレスクリーニングとして創薬を進めてきているが、癌ゲノムデータベースと健康/医療情報との融合や社会展開については、これからである。癌ゲノム日本イニシアチブを推進するために、現時点で何ができるか課題なのかこのセッションで明らかにしていきたい。

In the wake of clinical sequence (reimbursed from June 2019) based by NG, strong expectations will set for impact on precision medicine—an anticipated transformation in the diagnosis, treatment, drug target discovery and prevention of cancer. Site initiated research for Genomic sequencing has rapidly promoted prescreening for clinical trials, but implementation into healthcare/medical informatics is immature and insufficient. The Japan genomic-medicine initiatives are possible driving transformative change under real-life data while simultaneously addressing barriers to implementation and gathering evidence for wider adoption. We discuss Japan initiative genomic & medical informatics and will set next milestone in this session.

**Defective DNA damage repair in cancer microenvironment**

発がん微小環境におけるDNA修復欠損の役割

Chairpersons: Masanori Hatakeyama (Dept. Microbiol., Grad. Sch. Med., Univ. Tokyo)

DNA molecules are continuously attacked by a host of endogenous and exogenous genotoxic stressors. DNA damage has long been known as a carcinogenic factor and a defective DNA damage repair likely leads to catastrophic events on the genome in cells, accelerating malignant transformation and cancerous growth through accumulation of additional mutations and enhancement of chromosomal instability. In order to prevent these tragic ends, a whole picture of pathways regulating DNA damage repair and quality of chromosomes has to be unraveled. In addition, DNA damage repair systems not only comprise a protective mechanism against cancer development but also provide an important avenue for development of anti-tumor chemotherapies. In this session, the speakers will highlight recent advances in the molecular mechanisms underlying DNA double-strand break repair and nucleotide-excision repair. Quality control of chromosomes and oncoprotein-induced genomic instability will also be discussed. A better understanding of the complex DNA repair machineries will provide a cue to develop innovative cancer therapies.

Cancer immunotherapy is composed of various treatments targeting different immunological systems. Although some have been established to control cancer progression, or actually to cure it, but many mysteries remain to be elucidated. What kinds of mechanism and biomarkers are concerned in the efficacy, inefficacy and adverse response of cancer immunotherapy? In this session, speakers can provide the latest scientific findings of these mechanism and biomarkers to select the best combination immunotherapy and to reduce the adverse events associated with these treatments. And we discuss future directions of basic and clinical research in cancer immunotherapy.

The intervention with treatment for cancer cells has facilitated tumor evolution and leads to be acquired drug resistance. In addition, some population of patients shows the intrinsic resistance to systemic or local therapy. Therefore, the initial therapeutic intervention has a crucial role for the survival of patients. Currently, drug tolerant cells were paid much attention to play a pivotal role in progression of tumor heterogeneity because these are considered to eventually enhancing tumor recurrence. However, it is not completely understood how to prevent from drug tolerant cells in the development of tumor heterogeneity, related to epigenetic changes in treated cells. In this session, we will discuss the new aspects of tolerant mechanisms in cancer treatment and novel strategies for prevention of them.

Frequency of each cancer type diverse among regions on the globe. Cancers frequently occur in Asian area include those of esophagus (squamous-type), stomach, liver, biliary tract and T-lymphocyte. They are associated with characteristic infections (bacteria or virus) and environmental exposures of carcinogens, and are also still hard to treat. Considering explosive increase of populations in Asia, future estimated burden of these cancer types is a critical health issue. To explore the treatment and prevention of these cancers, we need to understand unique molecular features and carcinogenesis processes. In this symposium, seven researchers including four from abroad will present recent research progress on these Asian-frequent cancers.

Brain metastasis is a grave complication for cancer patients that seriously affects quality of life, and often becomes the direct cause of death. As the prognosis of cancer patients improves with the recent advancement of molecular targeting drugs, how to control and treat brain metastasis is more than ever important. On the other hand, molecular mechanism of brain metastasis has not been the target of vigorous research in the post-genome era. In this symposium, we focus on this specific issue starting from clinical studies in pursuit of best current management, proceeding to discuss experimental and clinical investigations to elucidate molecular mechanisms of brain metastasis. Connecting those studies will provide insight into the future measures to improve outcome of the patients with various cancers.

Room 9 Sep. 26 (Thu.) 9:00-11:30 J

### SST1 Present situation and future prospect of the genome project of pediatric and AYA cancers

小児・AYA がんにおけるゲノムプロジェクトの現況と今後

Chairpersons: Tatsuro Tajiri (Pediatric Surg., Kyoto Pref. Univ. of Med.)  
Junko Takita (Dept. Pediatrics, Grad. Sch. of Med., Univ. of Kyoto)  
座長：田尻 達郎（京都府立医大・小児外科）

Recent advances in genome-scale technologies and the ensuing outpouring of genetic information related to cancer have accelerated the convergence of discovery science and clinical medicine. Indeed, by examining the molecular profiles of human cancers using next-generation sequencing (NGS) and analytical tools have identified a number of druggable genetic aberrations and molecularly defined disease subtypes that may inform treatment decisions in many types of cancer. Therefore, there is a need to better understand the genetic basis and landscapes of human cancers as well as new applications of genome-wide technologies to accelerate the translation of genomic insights into clinical practice. In this Symposium, cutting-age researches in the field of cancer genome will be discussed across different types of cancer.

Cancer cells are exposed to various stress during malignant tumor growth. For example, "hypoxic, acidic, or malnutrition environments etc." and "oxidative, ER, or replication stress" are known as extrinsic and intrinsic stress, respectively. Molecular mechanisms about how cancer cells adapt to the stress have drawn remarkable attention since they have been suggested to enhance malignant progression, invasion, metastasis, and drug/radiation resistance of cancers. In this symposium, four speakers will present their findings about stress response of cancer cells and provide insights into the development of novel strategies for treatment, diagnosis, and prevention of cancers.

Genetic and epigenetic changes in combination with external signals and selective pressures generates intratumoral heterogeneity, which is among the greatest challenges in precision cancer therapy. Recent advancement in measuring the variation of gene expression levels within cells of the same tumor is crucial in dissecting the diverse cellular populations of tumors, such as immune cells and vascular cells, and may partly explain the unpredictable outcomes of cancer treatments. In this symposium we will discuss recent advance in single cell omics and imaging technologies that would enable precise investigation at single cell resolution.

### Carcinogenesis experiments revisited

座長：若林 雄一（千葉県がんセ・研）

For more than 100 years, carcinogenesis experiments using many types of animal models have been conducted in Japan. In addition to the chemical carcinogenesis model that has been done for a long time, a number of animal models have been produced. It is now possible to easily perform the production of new genetically modified animals, with the advent of CRISPR / Cas9 in recent years. The purpose of this session is to invite six speakers who conduct animal carcinogenesis experiments using the latest models from the classic model, and to discuss the current situation and the future image, while reflecting on the history of animal experiments in Japan.

It goes without saying that the evidence for optimal cancer therapies is acquired through high-quality international collaborative research. At the same time, diverse efforts are needed to share with the world the outstanding healthcare approaches established by Japan and to promote their application in the real-world medical care. In this special program, we would like for us to explore potential paths forward by having the speakers present their insights on: the various challenges in carrying out international collaborative investigator-initiated clinical trials led by Japan; the formulation of oncology enrollment standards for developing global big data science going forward, and the implementation of related international awareness-raising efforts; strategies for globally deploying Japanese healthcare practices; and the current state and future outlook of cancer research around the world, especially in Asia.

Communication between cancer cells and host cells, which may be hostile or friendly, determines the fate of cancer cells at the site of birth and also at the remote colonies. Although there are a number of in vitro experiments and animal models supporting the crosstalk, the interaction of cancer cells with the host cells has been rarely visualized under microscopes due to technical difficulties. Moreover, to gain insight into the mechanism of cancer cell growth, it is essential to know the activity changes of signaling molecules not only in cancer cells, but also in host cells. Invention of two-photon excitation microscope has opened a window to observe the interaction of cancer cells and host cells in live tissues. Meanwhile, development of various indicators and genetically-encoded biosensors enables the researchers to visualize the activities of signaling molecules in live tissues. This symposium focuses on the recent progress of in vivo microscopy, which helps us to fill the gap between in vitro experiments and animal models.

Although the immune and vascular systems have been shown to have strong influences on cancer, the role of the nervous system in regulation of cancer development remain largely unknown. The nervous system controls several biological activities of many organs in our human body, and, cancer is no exception. Current studies have reported that sympathetic and parasympathetic nerve fibers from the autonomic nervous system infiltrate tumors and contribute to the early stages of cancer development, as well as tumor metastasis. This session will discuss the current state-of-art of emerging role of nervous system for cancer research area, especially in creating a favorable microenvironment for the progression of tumor formation and metastasis. Our new approach for “Nerve-Cancer Cross-talk” will present a novel platform for cancer diagnosis and therapeutics.

It remains still challenging to cure the patients with many types of advanced cancers, despite so many clinical trials toward this goal. In this symposium, novel trials will be presented regarding chemotherapy, radiotherapy and immunotherapy.

In addition, some new attempts on peritoneal and liver metastases will be presented. Finally a newly established cancer treatment utilizing oncolytic virus will also be presented. We hope that attendees will obtain useful information by participating in this symposium, and will cultivate their thoughts toward treatments of refractory cancers.

Breast cancer is the leading malignant disease for Japanese women. The incidence rate would be estimated at 100,000 in a year. However, multidisciplinary approach is successful in early and advanced breast cancer. This symposium focuses on current topics of breast cancer management based on the molecular profiles and their-related targeted therapies. Prof. Arai will talk about hereditary breast and ovarian cancer syndrome regarding genetic and clinical characteristics of BRCA-mutated patients and carriers. Prof. Ota will present new treatment strategy against PARP inhibitor-resistant breast cancer. Prof. Noguchi will report about development of molecular diagnosis of breast cancer in precision medicine. Finally, Prof. Naito and Miyoshi will demonstrate up-to-date information about targeted therapies of HER2-negative and HER2-positive breast cancer, respectively. The participants will be satisfied with informative contents from this session.
