Immune-checkpoint inhibitors particularly PD-1/PD-L1 blocking antibodies are effective in patients with various advanced cancers. However, response rates are around 10-30% of the patients. One of the strategies to improve their efficacy is combination immunotherapy along with anti-PD-1/PD-L1 antibodies, and combination therapy may also prevent escape of genetically heterogeneous cancer cells from anti-tumor immunity. In this symposium, we will discuss a variety of potential targets and their modulators useful for combination cancer immunotherapy in mouse *in vivo* model, including nanoparticle forms of tumor antigen vaccine, new adjuvants such as TLR- and STING-agonists to stimulate antigen presenting cells, various inhibitors specific to immunosuppressive factors such as IL-6, TGF-beta, CAFs and TAMs, probiotics using intestinal commensal microbiota, and gene-engineered anti-tumor T cells such as CAR-T cells. The findings from these researches will lead to not only development of more effective immunotherapy for cancer, but also advance of cancer immunology.

### Chromosome dynamics in cancers

がん細胞の染色体ダイナミクス

Chairpersons: Toru Hirota (Exp. Path. Div., Cancer Inst., JFCR)

Satoshi Tashiro (RIRBM, Hiroshima Univ.)

One of the most remarkable and widespread features of cancer cells is chromosomal abnormalities, which often affects both number and structure. The numerical aberration, i.e., aneuploidy, arises through a pathological condition called chromosomal instability (CIN) which allows persistent gain or loss of whole chromosomes during cell division. Chromosomal structural instability (CSI) causes various types of large scale chromosomal rearrangements, which typically arises through errors in DNA repair process. Both CIN and CSI are associated with carcinogenesis and disease progression with increased invasiveness and resistance to chemotherapy, as these instabilities confer inter-cellular heterogeneity to tumors providing cancer cells to evolve. In this session, we assemble latest studies on CIN and CSI, aiming to investigate the causes and consequences of chromosomal abnormalities in cancers. Moreover, we will discuss about the establishment of mathematical modelling of CIN and CSI. These efforts should lead us to facilitate developing interventions targeting cancer cells with CIN and CSI, to prevent carcinogenesis and slow disease progression.

In order to realize precision medicine approach, the development of high-performance biomarkers with innovative drug discovery is extremely important. At the same time, state-of-the-art technologies have also allowed us to better probe and understand the heterogeneity of cancer which is unique to each individual. In order to see that these useful technologies are implemented on a larger scale, development of more accurate next generation diagnostic methods and companion diagnostics will be needed in stratifying patients into each subgroup. Currently, there is great interest and effort in the development of innovative diagnostics which include novel technologies for the detection of exosomes or extracellular vesicles, circulating tumor cells, epigenetic alterations, ribonucleic acid modifications, stromal components of tumor tissues, immunity, epithelial defense, cancer cell deformability and mechanobiology. Some of these techniques has led to liquid biopsy approaches for precision treatment for cancer patients. In this symposium, we have a line-up of exciting lectures on current leading-edge biomarker technologies from academic leaders and young scientists from the East Asia region.

On the basis of paradigm-shift in medical science from model studies to direct analyses of human materials, population-based and disease-oriented cohorts/biobanks are being constructed in all over the world for establishing precision medicine. Cohorts with a large number of individuals/patients with health/clinical records and biomaterials of high quality, such as genomic DNA, serum/plasma or affected tissues, followed up for a sufficient time period provide valuable resources for accelerating precision medicine. In Japan, a number of well-organized population-based and disease-oriented cohorts/biobanks has been established and managed for cancer research. Furthermore, clinical biobanks with medical records and biomaterials from patients have been recently constructed for more specified research purposes. In this symposium, roles of representative cohorts/biobanks and their contribution to cancer research will be presented and excellent examples of research outcome obtained by cohorts/biobanks studies will be demonstrated. Significance of cohorts/biobanks in cancer research as well as current and future directions in these activities will be discussed by panelists after each presentation.

### Advancement of cancer stem cell biology and novel therapeutic approaches

がん幹細胞生物学から展開する新たな標的治療への道

Chairpersons: Noriko Gotoh (Cancer Res. Inst. Kanazawa Univ.)

Jingxuan Pan (Zhongshan Sch. of Med., Sun Yat-sen Univ., China)

It is now well-known that cancer tissues are composed of very heterogenous cancer cells including cancer stem-like cells and differentiated cancer cells. It has been emerged that the differentiated cancer cells have plasticity to be dedifferentiated. Many novel molecular targeting drugs against cancer stem-like cells are now under development. However, there still remain many unsolved questions how these heterogenous cancer cells are maintained in the cancer tissues. The microenvironment surrounding cancer cells appear to play key roles. Very recent cutting-edge technology such as single cell analysis and metabolome analysis may solve some of the unsolved questions. In this symposium, we would like to introduce recent advancement of this field, protein modification, epigenetic changes, metabolism, single cell analysis, for example, and discuss novel potential therapies hoping to eliminate cancer stem-like cells for completely cure of the disease.

There is growing evidence suggesting that cancer development is achieved not only through sequential acquisition of oncogenic mutations, but also through cell-cell interactions not only within a heterogeneous tumour but also with its surrounding tissue. Model organisms have made great contributions for understanding such complicated cancer processes. In addition, these organisms are now powerful for exploring and evaluating new cancer therapies. This symposium, speakers will highlight advanced research in various model organisms regarding the mechanism of tissue homeostasis, tumorigenesis, tumor progression and the development of novel cancer drugs/therapies, which will guide us in future directions of cancer research.

Clinical trials are indispensable in pursuing the utility of basic researches in human subjects, as well as providing novel research ideas to basic researchers. Clinical trials use specific procedures that are designed to minimize the biases intendedly or unintendedly brought in by the clinical researchers, and to control the errors within the range of occasional fluctuations. Basic researchers who plan to investigate the value of their achievement in clinical medicine requires to understand the methodology of the clinical trials that may seem peculiar at a first glance. The aim of this symposium is to accelerate collaborations between the basic and clinical researches by promoting the understanding of both technologies.

### SST3 New insights in urologic oncology research

泌尿器がん研究の最前線

Chairpersons: Hirotugu Uemura (Kindai Univ., Faculty of Med., Dept. Urology)  
Masayuki Nakagawa (Dept. Urology, Kagoshima Univ. Grad. Sch. of  
Med. & Dent. Sci.)

座長：植村 天受（近畿大・医・泌尿器科学教室）

The recent approval of several I-O drugs have revolutionized the scenario of therapeutic management of advanced renal cell carcinoma and urothelial cancer. Furthermore, there have been developed several new hormonal agents for metastatic castration resistant prostate cancer as well as metastatic hormone sensitive prostate cancer. It remains unclear how to choose suitable patients for these new agents, although these new agents improve clinical outcomes to some extent. Many researchers attempt to find biomarkers and to develop methods to predict the best response to these new agents. Another critical issue on these new agents is how to predict and cope with adverse events different from conventional chemotherapy.

In this symposium, we have 6 distinguished uro-oncology researchers. They present the latest data on RCC pathology, translational models, drug-resistance mechanisms, microRNA profiling, liquid biopsy, and molecular subtyping in urologic oncology field.

We hope that audience can share the latest information and extend the knowledge and research.

In the last decade, we have witnessed the great advance in cancer immunotherapy. The attention culminated when 2018 Nobel prize in Physiology/Medicine was awarded to two scientists for their discovery of cancer therapy by inhibition of negative immune regulation. In this session, we will hear the state-of-the-art progress in the field by four top scientists, including Dr. Honjo, a co-awardee of the Nobel prize.

### Convergence science

がん克服に向けた英知の結集

Chairpersons: Peter Kuhn (USC Michelson Ctr.)

Tatsushi Igaki (Lab. of Genetics, Kyoto Univ. Grad. Sch. of Biostudies)

座長：Peter Kuhn (USC Michelson Ctr.)  
井垣 達史（京都大・院生命）

The past decade has seen tremendous advances in cancer care driven largely by better understanding of cancer genetics and biology. Characterization of the DNA changes driving cancer formation is now routine, yet cancer as a disease is still difficult to treat. Despite the ever greater availability of drugs and an increasing level of improved outcomes, long term remission remains a great uncertainty for most patients. Cancer does not occur merely as an isolated event in a polystyrene well, or on the hindlimb of an inbred mouse. It occurs in people, and people are unique. We are missing key details if we lack the context of human biology, physiology, and metabolism. Not just the tumor microenvironment, but also the macroenvironment. Herein, the cancer biologist, geneticist, or physicist, must rely on the physician to give key details about the patient. Are they old or young? Are they sick or healthy? Where has the cancer spread? From what continent where the patient's ancestors raised? To tackle this problem, all stakeholders must join with the focused goal of improving outcomes for cancer patients as the ultimate point of convergence.

Concept of cancer stem cells has given us a lot of hints for cancer biology and keys to solve current limitation of cancer treatment. For example, cancer stem cells play critical roles in cancer progression, such as invasion, metastasis, and drug resistance. However, there still remain several issues to be investigated, such as mechanisms of cancer stem cell maintenance, interaction with cancer stem cell niche, diversity and plasticity of cancer stem cells. Therefore, we have to clarify these remaining issues in order to develop cancer stem cell-targeted therapies. In this symposium, six speakers will present their front-line data on cancer stem cells. Through their unique views, we would like to discuss current status and future perspective of cancer stem cell research.

Clinically approved drugs such as enzyme inhibitors, receptor agonists/antagonists and antibodies target a variety of proteins to show their therapeutic activities. However, more than 70% of the proteins expressed in cells are thought to be undruggable with the currently available drug development technologies. To make the undruggable targets druggable, novel technologies are recently developed to suppress the expression of target protein level. In this session, chemical technologies to induce protein degradation and to suppress protein synthesis will be presented, which are platform technologies potentially applicable to target many undruggable proteins.

Advances in basic technologies drive certain changes in cancer research and therapeutics. Elucidation of fine molecular structures by crystallographic and/or cryo-electron microscopic approaches facilitates not only particular understanding of mechanisms for aberrant actions of oncoproteins but also molecular design for drug discovery. A hot topic in drug discovery is the middle molecule drug discovery, particularly macrocyclic peptides. Macro cyclic peptides give an outstanding performance (inhibition or promotion) to target molecules. Nano-level observation by high-speed atomic force microscopy enables real-time video filming of molecular dynamics, which proves hypothetical models or sometimes reveals a new mechanism different from expected one. Advanced single molecular technologies to detect molecular imaging and protein-protein interactions of oncoproteins are used for diagnosis. Chemical engineering has been progressing to manufacture intelligent materials for better drug delivery in cancer treatment. In this international session, development and application of unique nano-technologies toward cancer science and precision medicine are introduced by young researchers.

Although a large quantity of omics data, such as genome, epigenome, transcriptome, proteome and medical images, with detailed clinical information are available for cancer research in the enlightened times of the postgenomic era, it has been technically difficult to efficiently analyze enormous medical data in an integrated manner until recently. However, the current progress of the artificial intelligence (AI) technology, which is mainly based on the development of Machine Learning and computer performance, enables the integrated analysis of medical big data. In particular, Deep Learning, which is part of a broader family of Machine Learning methods based on learning data representations, is responsible for many of the recent breakthroughs in AI, and it has already been reported that Deep Learning outperformed humans in many tasks. In this session, we will discuss topics on application of artificial intelligence for cancer research, in particular focusing on integrated analysis of medical omics data using Machine Learning and Deep Learning.

Epigenetic therapy is rapidly expanding. DNA demethylating agents and histone deacetylase inhibitors are now used in practice, and next-generation drugs are being developed. Epigenetic modifications targeted currently includes writers, erasers, and readers of DNA methylation, histone acetylation, and histone methylation. Epigenetic targets can now include transcription factors, non-coding RNA, and chromatin remodeling. Genomic structures targeted are expanding from promoters to enhancers and repeat sequences. Target cells are not limited to cancer cells, but include cancer stromal cells. From these new waves, symposium of this year will pick up targeting transcription machineries, targeting stromal cells, targeting enhancers, DNA demethylation for prevention of disease progression, and exploitation of epigenomic consequences of the K27M mutation.

### Strategies for identification and prevention of cancer high risk group-borderless approach encompassing monogenic and multifactorial diseases がんのハイリスク群の捕捉と予防戦略—単一遺伝子疾患から多因子疾患までを包含するボーダーレスなアプローチ

Chairpersons: Kokichi Sugano (Genome Ctr., Tochigi Cancer Ctr.)  
Keitaro Matsuo (Div. Cancer Epi. Prev., Aichi Cancer Ctr. Res. Inst.)  
座長：菅野 康吉（栃木県がんセ・ゲノムセ）  
松尾 恵太郎（愛知県がんセ・研・がん予防）

Cancer has long been a major cause of mortality for Japanese people. A consistent increase in cancer incidence equals the life longevity in Japan. An average age at the onset of cancer now exceeds 70 year old in the top 5 cancer types such as cancers of the stomach, lung, colon, prostate and liver, except for female breast and uterine cancers growing estrogen-dependent. Considering the efficient cancer prevention with limited financial and human resources, it is a possible way to target "high risk groups", and further stratify preventive intervention. In this session, researches with regard to "high risk group" based on the viewpoints of sporadic to familial cancer, environmental to genetic factors will be presented by experts in the field.

## Role of Translational Research in Radiation Oncology

放射線治療のトランスレーショナルリサーチと臨床へのインパクト

Chairpersons: Tetsuo Akimoto (Dept. Radiation Oncology, Natl. Cancer Ctr. Hosp. East)

Radiation therapy has been established as a standard treatment modality for various cancers or neoplasms, and combined radiation therapy with molecularly targeted agents or immunotherapies has been introduced to further improve clinical outcomes. Chemotherapy alone is still insufficient to control solid malignancies, indicating that establishment of combined approach including that radiation therapy is important issue and translational research would be indispensable to clarify the difference in individual radio-response and/or combined effect of radiation and chemotherapeutic agents. However, translational research in radiation oncology area is still under development, and several issues including sample collection and its analysis to be solved exist. In this symposium, we will discuss preclinical and/or clinical progress of translational research in radiation oncology based on the presentations from the experts of this area.

本シンポジウムは、日本癌学会が女性研究者、女性医師の躍進を目指して、2014年から毎年開催しています。今年も第一線で活躍中、または今後活躍が期待される、女性研究者・女性医師に最先端のがん研究をご発表いただきます。発表演題は公募より選ばれ、優れた発表者にはWSCRシンポジウム賞が授与されます。女性研究者への期待と応援の気持ちを込めて、男女問わず、多くの方の来場をお待ちしています。

It has long been a major issue that the number of woman scientists, especially principal investigators (PIs), is low in Japan compared with other countries. Therefore, Japanese Cancer Association (JCA) has been making an affirmative action to expand the population of woman scientists in cancer research, and a series symposium "Woman scientists in cancer research (WSCR)" has been held every year since 2014. The purpose of this symposium is to introduce high quality sciences carried out by active women scientists to enlighten and encourage the next generation. This year, we have selected six women scientists from the open applicants, and the presenter will orally present their cutting-edge cancer research. The most outstanding presenter will be awarded the WSCR Symposium Award from JCA. We will also have a special lecture by Professor Junko Takita from Kyoto University Graduate School of Medicine.
