

Kyoto Declaration

The Japan Endocrine Society 100th Anniversary Ceremony

June 5 (Friday), 2026

Kyoto International Conference Center

Since its founding in 1925, the Japan Endocrine Society has contributed significantly to public health and the advancement of medical science. Paying tribute to this legacy and upholding our professional pride as specialists in endocrinology and metabolism, we commit ourselves to the following initiatives as we look toward the next century.

- We widely disseminate accurate and up-to-date information regarding hormones, endocrinology, and metabolism to society, and promote public awareness activities aimed at achieving early diagnosis and high-quality treatment for endocrine and metabolic disorders.
- In light of advances in artificial intelligence and information science, we establish a sustainable clinical care framework for endocrine and metabolic disorders that addresses rapid societal shifts and the challenges of a declining birthrate and aging population. We contribute to the enhancement of public health and welfare by providing advanced, specialized medical care and strengthening regional coordination.
- We support the aspirations and endeavors of the young physicians and researchers who pave the way for the future, providing them with a platform for innovation. We nurture the next generation of leaders in endocrinology and metabolism who learn from pathophysiology and take pride and joy in their contributions to society.
- By bringing together diverse expertise, we advance the elucidation of the pathophysiology of endocrine and metabolic disorders, the discovery of novel hormones, and the pioneering of specialized domains. Through interdisciplinary integration, we aim to deepen and advance the field of endocrinology and metabolism.
- Respecting those with diverse backgrounds who aspire to the field of endocrinology and metabolism, we strengthen international collaboration and provide leadership in the field across Asia and the wider world.

Through these initiatives, we will pass on the legacy of Japan's history in endocrinology and metabolism to the future, and by harmonizing cutting-edge science and technology with human-centered medicine, we will create the next generation of endocrinology and metabolism.
